It was common for computer music producers to create their own presets for electronic instruments. When one person is making music on a particular instrument, they sometimes wanted to apply the same preset to a different instrument. However, it would have been impossible to do so manually. Presets allow you to set the parameters of a preset to a particular value for a particular instrument or device, saving the changes you make for future use. You can use presets in Ableton Live for example, to quickly adjust the parameters of an instrument without a lot of effort. Users have been creating their own preset folders with similar plugins for a long time. However, a preset manager makes it possible to create and store presets with high level of customization and control.
