## What's New in the Minimum Profit?

Minimum Profit is a simple code editor (a clone of notepad) that offers a lot of flexibility for programmers who want to customize their tools. The app is mainly written in programming languages like C and C++, and it can be modified only using a C-like language. The Console and the GUI, plus dedicated scripting language First and foremost, Minimum Profit is portable, which means it a mobile instrument that can easily be configured to function on different machines. The tool is available for Windows and Linux systems. For Windows OS, it has two types of portable binaries: the console and the GUI version. This means you can access the same functions in two ways. Besides a fully scriptable interface, the tool uses its own dedicated, custom-made (by the developer) scripting language — MPSL (Minimum Profit Scripting Language). This programming language is a free-form language, which means users can format and indent it how they see fit. It is a mix of other concepts and practices found in popular languages like C, Perl, and Java/JavaScript. You can read more about the language's syntax [here](#).
